

U.S. Patent No. 6,409,112

4. All six brake weights "disengaged". Maximum braking is obtained when all six brake weights are in the "engaged" position.

**Note:** Reel ship with this setting  
two brake weights "disengaged".

1. All six Diakre weights engaged;

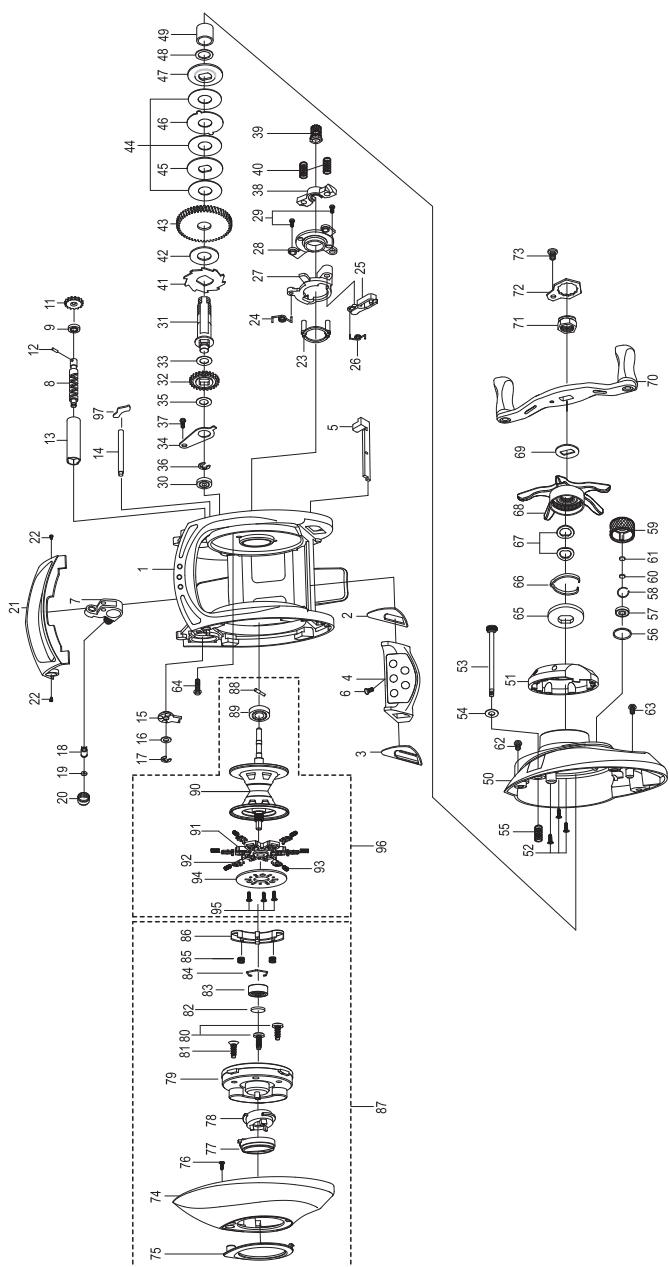

drake weights must be set in  
balanced. That is, a single weight  
engaged" by itself. The possible

System™ for the set-up that best suits your fishing needs.

With this Patent Pending design, an adjustable six-pin centrifugal brake system is combined with an extremely adjustable magnetic settings. Both braking systems work in conjunction with each other to provide the ultimate casting experience. The primary function of the centrifugal brake system is to control spool speed and prevent backlash at the beginning of the cast when spool RPM's are near the greatest. The magnetic brake system slows the spool down near the end of the cast to prevent line overrun. The centrifugal brakes are preset at the factory with 4 brakes on or engaged, providing maximum braking from the centrifugal casting system. The brake weights can easily be locked or disengaged, for a faster spool rotation to maximize your casting distance: the magnetic braking system is easily adjusted externally with the magnetic brake dial on the slideplate of the reel. For
